## Linear Regression - Project Exercise

Congratulations! You just got some contract work with an Ecommerce company based in New York City that sells clothing online but they also have in-store style and clothing advice sessions. Customers come in to the store, have sessions/meetings with a personal stylist, then they can go home and order either on a mobile app or website for the clothes they want.

The company is trying to decide whether to focus their efforts on their mobile app experience or their website. They've hired you on contract to help them figure it out! Let's get started!

Just follow the steps below to analyze the customer data (it's fake, don't worry I didn't give you real credit card numbers or emails).

### Imports

Import pandas, numpy, matplotlib, and seaborn. Then set %matplotlib inline (You'll import sklearn as you need it.)

```
In [2]: import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
%matplotlib inline
```

### Get the Data

We'll work with the Ecommerce Customers csv file from the company. It has Customer info, such as Email, Address, and their color Avatar. Then it also has numerical value columns:

- Avg. Session Length: Average session of in-store style advice sessions.
- Time on App: Average time spent on App in minutes
- Time on Website: Average time spent on Website in minutes
- Length of Membership: How many years the customer has been a member.

Read in the Ecommerce Customers csv file as a DataFrame called customers.

```
In [3]: df= pd.read_csv('Ecommerce Customers')
```

Check the head of customers, and check out its info() and describe() methods.

```
In [4]: df.head()
```

Out[4]:

	Email	Address	Avatar	Avg. Session Length	Time on App	Tir Wi
0	mstephenson@fernandez.com	835 Frank Tunnel\nWrightmouth, MI 82180-9605	Violet	34.497268	12.655651	39.5

max	36.139662	15.126994	40.005182	6.922689	765.518462

```
In [7]: df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 500 entries, 0 to 499
Data columns (total 8 columns):
Email                500 non-null object
Address              500 non-null object
Avatar               500 non-null object
Avg. Session Length  500 non-null float64
Time on App          500 non-null float64
Time on Website      500 non-null float64
Length of Membership 500 non-null float64
Yearly Amount Spent  500 non-null float64
dtypes: float64(5), object(3)
memory usage: 31.3+ KB
```

## Exploratory Data Analysis

Let's explore the data!

For the rest of the exercise we'll only be using the numerical data of the csv file.

---

**Use seaborn to create a jointplot to compare the Time on Website and Yearly Amount Spent columns. Does the correlation make sense?**

```
In [10]: sns.set_palette("GnBu_d")
sns.set_style('whitegrid')
```

```
In [11]: # More time on site, more money spent.  
sns.jointplot(x='Time on Website',y='Yearly Amount Spent',data=df)
```

C:\Users\q21\Anaconda3\lib\site-packages\matplotlib\axes\\_axes.py:6462: UserWarning: The 'normed' kwarg is deprecated, and has been replaced by the 'density' kwarg.

warnings.warn("The 'normed' kwarg is deprecated, and has been "

C:\Users\q21\Anaconda3\lib\site-packages\matplotlib\axes\\_axes.py:6462: UserWarning: The 'normed' kwarg is deprecated, and has been replaced by the 'density' kwarg.

warnings.warn("The 'normed' kwarg is deprecated, and has been "

```
Out[11]: <seaborn.axisgrid.JointGrid at 0x669dcc0>
```

**Do the same but with the Time on App column instead.**

```
In [12]: sns.jointplot(x='Time on App',y='Yearly Amount Spent',data=df)
```

C:\Users\q21\Anaconda3\lib\site-packages\matplotlib\axes\\_axes.py:6462: UserWarning: The 'normed' kwarg is deprecated, and has been replaced by the 'density' kwarg.

warnings.warn("The 'normed' kwarg is deprecated, and has been "

C:\Users\q21\Anaconda3\lib\site-packages\matplotlib\axes\\_axes.py:6462: UserWarning: The 'normed' kwarg is deprecated, and has been replaced by the 'density' kwarg.

warnings.warn("The 'normed' kwarg is deprecated, and has been "

```
Out[12]: <seaborn.axisgrid.JointGrid at 0xae36ef0>
```

**Use jointplot to create a 2D hex bin plot comparing Time on App and Length of Membership.**

```
In [14]: sns.jointplot(x='Time on App',y='Length of Membership',kind='hex',data=df)
```

C:\Users\q21\Anaconda3\lib\site-packages\matplotlib\axes\\_axes.py:6462: UserWarning: The 'normed' kwarg is deprecated, and has been replaced by the 'density' kwarg.

warnings.warn("The 'normed' kwarg is deprecated, and has been "

C:\Users\q21\Anaconda3\lib\site-packages\matplotlib\axes\\_axes.py:6462: UserWarning: The 'normed' kwarg is deprecated, and has been replaced by the 'density' kwarg.

warnings.warn("The 'normed' kwarg is deprecated, and has been "

```
Out[14]: <seaborn.axisgrid.JointGrid at 0xafc65c0>
```

Let's explore these types of relationships across the entire data set. Use [pairplot](https://stanford.edu/~mwaskom/software/seaborn/tutorial/axis_grids.html#plotting-pairwise-relationships-with-pairgrid-and-pairplot) ([https://stanford.edu/~mwaskom/software/seaborn/tutorial/axis\\_grids.html#plotting-pairwise-relationships-with-pairgrid-and-pairplot](https://stanford.edu/~mwaskom/software/seaborn/tutorial/axis_grids.html#plotting-pairwise-relationships-with-pairgrid-and-pairplot)) to recreate the plot below.(Don't worry about the the colors)

```
In [15]: sns.pairplot(df)
```

```
Out[15]: <seaborn.axisgrid.PairGrid at 0xb0f75f8>
```

**Based off this plot what looks to be the most correlated feature with Yearly Amount Spent?**

```
In [17]: sns.heatmap(df.corr())
```

```
Out[17]: <matplotlib.axes._subplots.AxesSubplot at 0xc353278>
```

**Create a linear model plot (using seaborn's lmlplot) of Yearly Amount Spent vs. Length of Membership.**

```
In [19]: sns.lmlplot(x='Length of Membership',y='Yearly Amount Spent',data=df)
```

```
Out[19]: <seaborn.axisgrid.FacetGrid at 0xc5cf320>
```

## Training and Testing Data

Now that we've explored the data a bit, let's go ahead and split the data into training and testing sets. **Set a variable X equal to the numerical features of the customers and a variable y equal to the "Yearly Amount Spent" column.**

```
In [26]: y = df['Yearly Amount Spent']
```

```
In [27]: X= df[['Avg. Session Length', 'Time on App', 'Time on Website', 'Length of Members
```

**Use `model_selection.train_test_split` from `sklearn` to split the data into training and testing sets. Set `test_size=0.3` and `random_state=101`**

```
In [28]: from sklearn.model_selection import train_test_split
```

```
In [29]: X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.3, random_s
```

## Training the Model

Now its time to train our model on our training data!

**Import `LinearRegression` from `sklearn.linear_model`**

```
In [30]: from sklearn.linear_model import LinearRegression
```

**Create an instance of a `LinearRegression()` model named `lm`.**

```
In [31]: lm =LinearRegression()
```

**Train/fit `lm` on the training data.**

```
In [33]: lm.fit(X_train,y_train)
```

```
Out[33]: LinearRegression(copy_X=True, fit_intercept=True, n_jobs=1, normalize=False)
```

**Print out the coefficients of the model**

```
In [294]:
```

```
Coefficients:  
[ 25.98154972  38.59015875   0.19040528  61.27909654]
```

## Predicting Test Data

Now that we have fit our model, let's evaluate its performance by predicting off the test values!

**Use `lm.predict()` to predict off the `X_test` set of the data.**

In [295]:

**Create a scatterplot of the real test values versus the predicted values.**

In [296]:

Out[296]: &lt;matplotlib.text.Text at 0x135546320&gt;

## Evaluating the Model

Let's evaluate our model performance by calculating the residual sum of squares and the explained variance score ( $R^2$ ).

**Calculate the Mean Absolute Error, Mean Squared Error, and the Root Mean Squared Error. Refer to the lecture or to Wikipedia for the formulas**

In [303]:

```
MAE: 7.22814865343
MSE: 79.813051651
RMSE: 8.93381506698
```

## Residuals

You should have gotten a very good model with a good fit. Let's quickly explore the residuals to make sure everything was okay with our data.

**Plot a histogram of the residuals and make sure it looks normally distributed. Use either seaborn distplot, or just plt.hist().**

In [317]:

## Conclusion

We still want to figure out the answer to the original question, do we focus our effort on mobile app or website development? Or maybe that doesn't even really matter, and Membership Time is what is really important. Let's see if we can interpret the coefficients at all to get an idea.

Recreate the dataframe below.

```
In [39]: coefficients = pd.DataFrame(lm.coef_,X.columns)
coefficients.columns = ['Coefficient']
coefficients
```

Out[39]:

	Coefficient
Avg. Session Length	25.981550
Time on App	38.590159
Time on Website	0.190405
Length of Membership	61.279097

How can you interpret these coefficients?

Type *Markdown* and LaTeX:  $\alpha^2$

Do you think the company should focus more on their mobile app or on their website?

Answer here

## Great Job!

Congrats on your contract work! The company loved the insights! Let's move on.
